A Critical Appraisal of Local Complications and Long-term Management of the Augmented Breast: Defining Standards and Resources for Improved Patient Care. Breast augmentation is the most common cosmetic surgical procedure performed on women in the United States today. Many of these women do not remain in regular follow-up with their cosmetic surgeons, and thus the true natural history and complication rates of implant surgery are not well defined. There is currently no standard protocol for follow up for office visits or for radiographic imaging. This is a problem not only for women with breast implants, but also for physicians who advise these women in their breast care. The physician researchers at Breast Implant Care seek to study these important issues by asking women who have been implanted or who plan to be implanted to participate in a landmark study and be followed by our surgeons over time. The follow up care would involve visits in a physician's office as well as appropriate radiographic studies.

**If you have any questions about the research or how you can participate,
you should contact:** Dr. Danielle DeLuca-Pytell by email at
